

Focus

on what we do best...

As a pioneering leader in the field since 1950, Seikagaku focuses on glycoconjugates, natural biological elements that play an important role in various life processes.

In 1987, we rolled out a hyaluronic acid formulation in Japan, the first as a joint improving agent in the world. Two decades later, our sales of this product continue to climb around the world because of its quality and efficacy. Our mission is to contribute to a richer quality of life using unique research and production technologies based on glycosaminoglycans (GAGs) for innovative products with high value, principally in the areas of joint disease, allergies/immune diseases and ophthalmic diseases.

With our new 10-year vision, started in April 2009, determining our future position as a “global category pharma,” we aim to leverage leadership in the glycoscience field for corporate growth, while contributing to medical care around the world.
